## MOPAR® FILTERS

Mopar® Filters are designed using Chrysler Engineering specifications, which means they can help maintain peak engine efficiency and performance.

**1. Internally Lubricated Seal Gasket** – Seal gasket is internally lubricated to provide better torque removal and easy replacement.

**2. Anti-Drain Back Valve** – Anti-drain back valve helps prevent dry starts. High heat-resistant “nitriles” in the valve help improve functionality and anti-drain back performance.

**3. Maximum Dirt Retention** – Engineered with high dirt retention capacity for longer service intervals and severe driving conditions.

**4. Adhesive-Filled Double Lock Seam** – Adhesive-filled double lock seam can withstand pressures up to 300 p.s.i.

**5. Fluted Case** – Fluted case allows easy installation and removal.

Regular oil filter replacement is important to remove abrasive particles that can cause engine wear. Oil filters should be changed according to mileage intervals listed in the owner’s manual, or more frequently when the vehicle is constantly put through stop-and-go traffic, short trips or dusty conditions.

The best opportunity for selling filters is at the time of an oil change or engine tune-up. The customer is likely to be most interested in the needs of his or her vehicle at these times. Look for a “Lube Sticker” showing the date or mileage of the last filter change.

NOTE: To determine the correct engine application on Chrysler, Ford or GM products manufactured between 1995 and 2009, use the 8th character on the VIN plate.

# ONE IN FOUR VEHICLES NEEDS A NEW AIR FILTER. DO YOUR FILTERS LOOK LIKE THIS?

Good performance and fuel economy can only be achieved with a clean air filter. An improperly functioning air filter can damage an engine by restricting airflow or allowing contaminants to enter. Air filters should be checked every 3,000 miles and replaced at 15,000 miles or less if dirty.

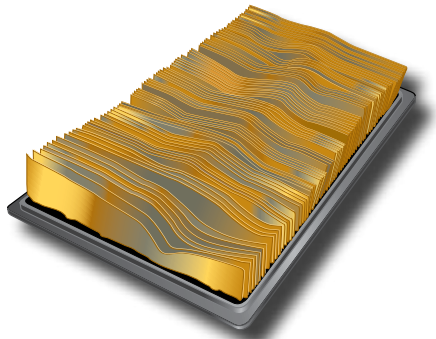

## NEW PANEL STYLE AIR FILTER

New filters should be free of rips, tears, punctures and excess contamination. Filters should be dry and the edges should be straight.

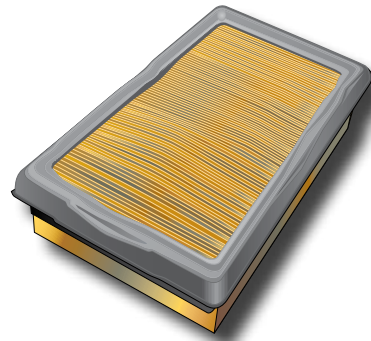

## CONTAMINATED AND COLLAPSED AIR FILTER

Inspect the filter media for excess contaminant accumulation, which can restrict airflow to the engine. Should the air filter become completely restrictive to airflow, it may collapse inward on itself due to high differential pressure between the inlet and outlet side of the filter housing. Filter collapse not only destroys the filter, it also allows free bypass of contaminants into the engine.

## MOISTENED AIR FILTER

Inspect the filter for wavy pleats, which can indicate possible moisture in the air intake system. Excess moisture in the air intake system can damage the filter and reduce its performance.

## PINCHED AIR FILTER

Carefully inspect the filter's rubber seal for signs of being pinched in the filter housing. A pinched seal indicates the filter may have been improperly installed, which can cause excess contaminants to bypass the filter and enter the engine.

Also inspect filter media for tears, rips or punctures, which can create paths for contaminants to enter the engine.

AUTHENTIC PERFORMANCE™
